Edits

Implementation of the comments feature on the database

Added a comment table to the schema with necessary fields:

Defined a commentStatus enum for comment moderation.

Defined Comment and CommentsData types for type safety and nested replies.

Created CommentRepository class with methods:

GetComments(initiativeId) : to fetch all top-level comments for an initiative, including nested replies.

GetReplies(commentId) : to recursively fetch replies for a comment.

CreateComment(initiativeId, userId, content) : to insert a new top-level comment.

CreateReply(initiativeId, userId, commentId, content) : to insert a reply to a comment.

UpdateComment(commentId, content) : to update a comment's content.

DeleteComment(commentId) : to delete a comment.

Added API routes for comments: (GET, POST, PATCH, DELETE)

Used dynamic route parameters for comment IDs.

Code Quality :

Refactored code to avoid duplication (buildCommentWithReplies helper for building comment trees).

Ensured all DB operations are awaited and errors are logged.
